Write a report on the history of electronic computers. Don’t talk about mechanical computers or the human brain! The report content should include but not limited to the following:

- Vacuum tubes and how they relate to computers, but don’t just talk about how they work.
- Transistors and how they relate to computers, but don’t just talk about how they work.
- Integrated circuits and how they relate to computers. Include an Excel chart (not just a picture of a chart) showing how the number of transistors inside an integrated circuit has increased through the years.
- The first IBM PC and Apple personal computers.
- The current personal computer.
- Other significant computers in the computer history.

Furthermore, the report should have the following features:

- A cover page.
- At least 800 words.
- A table of contents with appropriate section titles
- Footer with your name, page number and date on all pages except the cover page.
- A relevant picture (not a clipart) of a computer.
- A footnote.
- Reference(s) at the end.

**Bonus points:**

Include a table that lists the generations of the Intel CPUs used in the PC starting with the first IBM PC up to today. The table should include the CPU’s name (number), the year introduced, the approximate number of transistors used in them (this is related to the Excel chart that you need to do above.)
